THE EVENT THAT CHANGES EVERYTHING

By Bart Pals

History will prove exhibition poultry has never experienced anything like this. Mark your calendars for November 21st and 22nd, 2014 (two weeks after the wonderful ABA Anniversary show in Columbus). Prepare yourself for a spectacular event that will leave you excited for the next one.

Prestige is the key word, cash is the reality, and education will be the final result. This event promotes only North America's BEST in purebred poultry. This show does not promote huge numbers, it promotes PRESTIGE. APA/ABA rules are still in place but EVERYTHING will promote "class".

Entry is \$25.00 (twenty five) per bird, resulting in the largest amount of cash available for the winners in the history of purebred poultry.

Examples of available cash are:

1)-Based on two hundred birds entered-CHAMPION BIRD equates to \$1500.00 (plus an additional \$1100.00 in awards)

2)-Based on three hundred birds entered-CHAMPION BIRD equates to \$2500.00 (plus an additional \$1800.00 in awards)

3)-Based on four hundred birds entered-CHAMPION BIRD equates to \$3500.00 (plus an additional \$2600.00 in awards)

4)-Based on five hundred birds entered-CHAMPION BIRD equates to \$4500.00 (plus an additional \$3700.00 in awards).

This will be the first time anything like this has been accomplished and you will not want to miss history in the making. The more birds shown, the more cash available. APA points and ABA Starred wins will be available but

PRESTIGE is the goal.

Imagine the Nation's TOP breeders in a highly concentrated event where ANY bird exhibited has the legitimate capability of winning the show. EVERY BIRD IS A TRUE CONTENDER. Our goal is QUALITY not quantity. Imagine winning the BREEDERS CUP, and the bragging rights that will ensue. Imagine a top five placing at this event, and the honor that will bring. This competition will include only the cream of the crop and winners will be recognized THE BEST OF THE BEST by their peers.

Every APA/ABA recognized breed and variety of poultry is welcomed to be exhibited at the beautiful Events Center in Webster City, IA. Just north of Des Moines and Ames, Webster City is off I-35 and is the home of Murray McMurray Hatchery. The city has a beautiful new facility with stadium style seating so everyone can enjoy this event.

There will be a professional photographer to take photos of your birds FOR FREE. We will have a cocktail event on Friday evening and a white table cloth event on Saturday evening. Bermudian poultry breeder, and professional entertainer, Ronnie Lopes will be the emcee during the whole event.

Workshops are being scheduled for all the surrounding state's 4-H poultry project youth to come and learn, and also see the country's best breeders and their poultry.

Mark your calendars and plan your breeding/hatching season accordingly. For additional information :

Contact: BART PALS (641) 430-2916.

MARANS CHICKEN CLUB USA NATIONAL MEET

Shawnee, OK: December 14, 2013—The Marans Chicken Club USA's (MCCUSA) National Meet promises to be one of the biggest ones yet and will include the American Poultry Association (APA) qualifying meet for the White Marans variety.

For Marans enthusiasts, all eyes will be on

the Oklahoma State Poultry show in Shawnee this coming December 14, 2013. This will mark the club's 5th National Meet and the qualifying meet for the White variety.

The MCCUSA was founded in February of 2008 with a mission to strive for new variety acceptance, and to support its members in all their breeding efforts to fulfill this goal, and the goal of breeding for the darkest egg color possible. To date, MCCUSA has successfully achieved APA recognition of the Black Copper and Wheaten varieties. The club is hopeful that in Shawnee, the White variety will be the third variety recognized by the APA.

More than just the birds themselves will be on display there. The MCCUSA will also be holding an egg show, as well. "Since the dark brown eggs of Marans is what helps make them so popular, we will be hosting an egg show as part of our National Meet." said Davis.

Competition is expected to be strong at the club's National Meet. Entries are anticipated to reach 250 birds, with approximately 70 of them being Whites.

"We don't plan to stop with just adding the White variety, there are currently breeders working on other color varieties like the Blue Coppers, Blacks, and Blues and others in various stages of development.

APANEWS December 2013

First on my list: The APA election is coming in 2014. Anyone who is interested in running for office should send me their intent to run by December 15 so they can be included in the January edition of News & Views. Don't forget, the APA has been around since 1873 because people like you have donated their time and talent to keep it running.

Second on my list: The APA Board of Directors will be awarding the 2015 Annual Meet at their meeting in January at the Northeastern Poultry Congress show and annual meeting. The show must be held between September 1, 2015 and February 28, 2016. Any club or organization who is interested should contact me for a bid form.

Last, but very important: dues notices are coming, please try to respond as soon as you can so I can keep the membership database up to date and send election ballots to everyone who is an active member.

Dick and I attended the Ohio National in Columbus. It is always a good show and we can visit with people from out of our local area. This year was great for visiting and also good for sales and new memberships.

I also want to thank Pat Malone and Carl Brantley for their good work in increasing our membership; both directors have been very active in signing up new members. Keep up the good work!

Don't forget to get those champions ready for the Poultry Congress. It should be a great show, hope you can be there. I'm looking forward to seeing everyone and answering any questions I can for the members.

I had better get back to my paperwork; there is always a lot of year end things to clear up and this year there will be election ballots to prepare. Dick and I want to wish everyone a Merry Christmas and Happy New Year. I hope to see you somewhere down the road.

Pat Horstman

NATIONAL CALL BREEDERS of America

National Call Breeders of America
A club formed for the promotion of breeding and exhibition of Call Ducks, offering National, District and Special Meets. Quarterly newsletters and annual year-book.
Memberships: Junior (under 16) \$8/year; Individual \$15/year or \$29/2 years; Family \$17/year or \$33/2 years; Lifetime membership \$200. Visit our website at www.callducks.org to join online or purchase club merchandise, such as t-shirts, pins, patches, posters, etc.

ABA Happenings

December 2013

We have likely just a few days away for the ABA's 2013 National meet in Knoxville, TN. Knoxville is the place to be December 7-8 for the ABA National Meet. The winning bantam and reserve winning bantam will have a place of honor on the cover of the ABA's 100th Anniversary 2014 Yearbook. More on this show next month

The American Bantam Association is celebrating it's 100 years as we move forward into 2014. Yes – 2014 will be our 100th birthday and we are happy to be able to share lots of good things with you. The biggest news is our newest Bantam Standard which is due to be available November of 2014. This book will beat all books with color photos.

Yes – photographs will be the big news with this book and I would like to thank those who have come forward to help support this book with sponsorship contributions. All those who have taken a sponsorship will be acknowledged in this and future printings of the ABA Bantam Standard.

I would like to most especially thank all the people who are working on this project. "Thank you" goes to Matt Lhamon, Rick Hare, Clell Agler, Neil Grassbaugh, Brian Knox, Marty McGuire, and Jeff Halbach. Also many thanks to all the ABA members showing the birds that have been photographed for inclusion. This is not a simple project and these people are working very hard to keep this project on budget and on time. Thank you. We (the ABA members) are grateful for your constant efforts and contributions to the bantam fanciers of today and tomorrow.

To get involved, visit our website at www.bantamclub.com for sponsorship opportunities. They are only being taken thru December 31, 2013.

Now to talk a little about awards..... The ABA has a great award program built on the hard work of the show secretary's around the country. These volunteers send in the judg-

ing results to the ABA. Some of these wins qualify for our awards programs and are printed in the following year's yearbook. Those that are wins in classes of 100 or more bantams are noted with a Star *. These stars are cumulative and eventually can add up. If 20 or more stars are earned, the exhibitors (assuming they are paid up ABA members) are awarded the Master Exhibitor Award. If 20 or more are earned on a single breed and variety over a period of not less than five years, then that person is awarded the honor of Master Breeder. Yes – we take this one step further for those ready for the challenge. All stars are weighted, depending on the number of birds in the class. These wins are added up and if an ABA member reaches 20 Gold Starred wins, they are awarded the ABA Lifetime Achievement award. Currently, we have a mere 17 ABA members who have earned this distinction. Watch for details as there are bound to be a few more added in the near future. This is an incredibly difficult level of achievement - so congratulations to all who have made this very prestigious level of recognition.

All this awesome news on awards is great – but it hinges on one fact. Show reports must be sent in. It is not an easy task to run a show and calculate the results. But please - take those few days after the show to quickly do the paperwork and send in the reports. Your exhibitors will really appreciate it!

For those who are new to trying bantams, don't be afraid – we are a friendly group. I encourage you all to take a moment and \$20

to join the ABA today. We will send you a new member packet with the most current yearbook to help you get your flock started.

Best to all -

Karen Unrath - ABA Secretary

The Expression of Autosomal Pheomelanin (Aph) and the Inhibitor of Autosomal Pheomelanin (Aph^I) when in the presence of: Colombian (Co) and Dark Brown (Db – aka ‘Ginger’)

Part 3
By Brian Reeder

In my last two articles I have discussed Autosomal Pheomelanin (Aph) and the Inhibitor of Autosomal Pheomelanin (Aph^I) and their main interaction genes (September 2012) as well as the effects of both factors on the five most commonly encountered alleles of the e-locus (October 2012). This month, we will look at the last major (known) genes that interact with Aph and Aph^I: Colombian (Co) and Dark Brown (Db – aka ‘Ginger’).

Both of these factors are commonly called ‘eumelanin restrictors’ in the published literature on poultry genetics. I tend to refer to them as ‘pheomelanin extenders’, which is for all intents and purposes the same thing. The intent of either term being that these factors restrict eumelanin (black pigment) in the breast of the male, or extend pheomelanin (red/gold/silver pigment) into the breast of the male. However, restriction/extension is not the only function of these two genes.

Another major function of these genes is that they interact with Pattern gene (Pg) and Melanotic (Ml) to create the most widely known and beautiful patterns of exhibition and landrace poultry; namely autosomal barring, spangling (the real one, not mottling) and lacing. Dark brown (Db) is in fact linked to Pg and Ml as part of a fairly tight linkage group. Co is not linked with this group, yet works with these genes to create a unique expression of patterning (lacing).

When Db is found with only Pg, we see the pattern known as autosomal barring, as seen in campiness and “penciled” Hamburg. When Db and Pg are also found with Ml, we see spangling as in the Spangled Hamburgs. When Co is found with Pg, there is very little pattern, as without Ml, Co overpowers and washes out Pg. When Ml is then added, we see lacing. The two e-alleles where lacing is commonly seen are eb (brown) and ER (birchen). On the e-allele eb, lacing can occur with only Co/Pg/Ml, but on ER, Db is also

required, as Co without Db on ER is not strong enough to restrict the high levels of eumelanin found on ER. Db, however, does restrict the eumelanin of ER and is thus required to create lacing on the birchen background allele. These are not, however, the only genes that Co and Db interact with. Co and Db also interact with Aph and Aph^I and their other interaction genes (s+/S, Mh, Di, ig, etc.)

The interactions of Co and Db with Aph and Aph^I are very fascinating. In short, Co interacts most strongly with sex-linked pheomelanin (s+ and/or S – the s-locus alleles), while Db interacts most strongly with Autosomal pheomelanin. However, we cannot leave it there, as there is more to these interactions than that one sentence can sum up.

First, let’s look at Co. Colombian, as stated above, interacts most strongly with sex-linked pheomelanin, and it is sex-linked pheomelanin that Co extends into the breast and body of both sexes on all the e-alleles it effects (e+, eb and eWh, but ER ONLY when Db is present, and E not at all). Regardless of whether we see Aph or Aph^I, it is the sex-linked pheomelanin that Co extends into the typically eumelanin areas. On red (s+) birds, it is very easy to see on the males. An example is some lines of Buff Brahma in which the males show a shoulder and top of head/around face/outer hackle edge much darker than the rest of the body, but the breast is as light, if not lighter, than the lower hackle. This means that even though Aph and Mh are present, the presence of Co (without Db) does not allow them to effect the breast. It is even easier to see in silver (S) examples.

We often see silver Colombian males that have a clean, snow white breast, yet the hackle, saddle and shoulder will be cream/yellow – ‘brassy’. The yellowing of these areas is the result of the presence of Aph, yet there is no effect on the breast, showing that Colombian extends sex-linked pheomelanin into the breast of these birds and completely

restricts all expression of Aph on this area. A further example is that when Mahogany is present on a silver Colombian bird that has Aph instead of Aph^I, the result is a rooster with a clean white breast, yellow hackle and saddle and a Mahogany shoulder. Colombian thus restricts Aph from the breast, while extending sex-linked pheomelanin into the breast of the male.

The most desirable Silver Columbians are those that are homozygous for Aph^I, and have no Mahogany or other red intensifiers, as these will be a clean white silver. Further, when such genes as Dilute (Di) and/or cream (ig) are also present on these Aph^I silver Columbians, as we have discussed in previous articles on obtaining clean white silver plumage, the effect is magnified and we see none of the brassiness that even some good, clean lines show when exposed to sunlight.

However, this is not the end of the story for Colombian, because Colombian is often found with Db, and Db changes the game a bit. Before we look at the interaction of Db and Co, let us discuss Db.

Db is a very interesting gene and may actually be a major gene with one or more modifier genes, some of which may be linked, interacting to make what we think of as the typical Db expression of pheomelanin extension in both sexes. Dark brown is most commonly known from varieties such as ginger red, where it creates a warm tan-orange tone. However, Db can make other tones, depending on its interactions with such genes as Di or Mh. With Mh saturation, Db creates the typical Rhode Island Red phenotype and with the addition of one or more of the recessive black complex of factors, Db creates the exhibition form of Rhode Island Reds that might more appropriately be called “Rhode Island Near-Blacks”.

Dark Brown extends Autosomal pheomelanin into the breast area (as Co does with the s-locus alleles) and interacts most strongly with Aph/Aph^I. While Db does not extend the s-locus alleles, it does interact

with sex-linked pheomelanin by changing the tone of s+ to a tan-orange, especially when Di is present and Mh isn't present.

We can clearly see the effects of Db extending Aph (and by proxy Mh) into the breast, even when silver is present, in such varieties as the Red Shouldered Yokohama or some of the new color varieties of Serama known by various food-names (with no reference to their actual genetic components). There are very few standard varieties in the US that encompass Silver, Aph, Db and Mh. The Red Shouldered Yokohama being the only one I can easily think of (though this one is more complex than the simple S, Aph, Db, Mh combination discussed), but such combinations are seen in the standards of other countries and further, we often see this combination occurring in various landrace breeds (such as the Serama) as well as in various crossed birds where the color is marveled at as though it were some new spontaneous mutation (it isn't!).

In these combinations, male birds that are homozygous for silver (on e+, eb, eWh or ER), but that have Aph (and no Aph^I), along with Db and Mh show a dark red breast, back edge of the lower wing feathers, shoulder and back, but the hackles, saddles and main wing feathers (the "duckwing" triangle) are cream to pale yellow. The females will vary a great deal more than the males depending on the e-allele, but will express red in the body with silver/cream/pale yellow hackles with exact distributions based on their respective e-allele. These phenotypes are only possible due to Db extending Aph and Mh into the breast/body of these birds. Since Columbian does not extend Aph into the breast, such phenotypes cannot be created using Co alone.

When Db occurs with S and Aph without Mh, the result is a bird that is entirely pale

cream to light yellow throughout the body and hackles in both sexes, while the same combination but with s+ instead of S and ig will create a nearly identical phenotype. Db with s+, Aph, and Di without Mh creates the classic 'Ginger Red' phenotype. Add Mh to this and you get a slightly darker version of 'Ginger Red' that is more red and less tan or pumpkin. When there is Aph, Mh and no Di on red, we see the color of a typical Rhode Island Red and when recessive melanizers are added to that, we see the near black phenotype of the exhibition RIR. When Db occurs with Aph^I and S, we get a clean 'Silver Ginger', and the more dilution genes such as Di or ig that we add, the cleaner and whiter that silver will be. Without the diluters, S and Aph^I with Db will tend to be slightly brassy, but not the pale yellow of the same version with Aph instead of Aph^I.

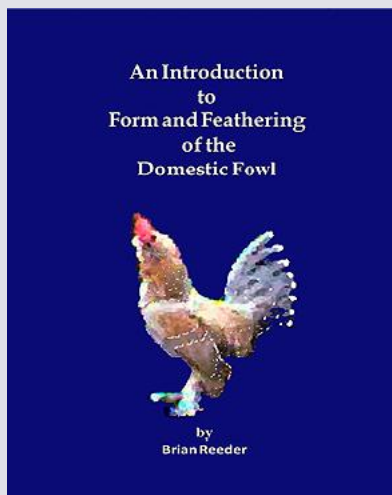

Now to make things even more complicated and confusing, Co and Db can interact. There is not just one effect. The first effect one will note is that in regards to Pattern gene, Co overpowers Db and so when Co and Db are combined with Ml and Pg, the resulting pattern is a lace. Co and Db on the same bird with Aph but without Mh allows Co to have the greater effect on the tone of the pheomelanin, but with Aph and Mh, Db has the stronger effect and allows Mh to saturate the pheomelanin in a manner that Co alone would not allow. This can be seen in such varieties as black laced red (as opposed to black laced gold or "golden laced"), white laced red and blue laced red where Co is clearly present due to the laced pattern, but the pheomelanin is much darker than one would typically expect from Co alone. In that instance, Db allows Mh to extend into the pheomelanically extended areas to create the dark red visual effect. Some of the medium red lines of pro-

duction RIR also have Columbian along with Mh and Db, though the show lines and darker production lines do not seem to have Co.

In the golden-laced varieties, Dilute (Di) plays a major role in lightening the tone to the bay color we expect. My tests show that all golden-laced birds (Sebright, Wyandotte and Polish) carry both Co and Db. Even when Mh and Aph are present in these cases, Co interacts with Di to allow the pheomelanin to be diluted to the golden tone, overpowering Mh and Aph and not allowing the expression of mahogany in the pheomelanin, except for partial expression on the male bird's shoulder and the upper hackle/head of both sexes.

When S is present instead of s+, along with Co and Db, and Aph, we see brassy silver laced with the palest area being the pheomelanin of the breast, while the rest of the pheomelanin areas are a cream to pale yellow. To secure the cleanest white in silver laced varieties, Aph^I must be present and homozygous, whether Db is present or not. In instances where Mahogany and Aph are present on silver laced birds with both Co and Db, Mahogany is restricted and still does not influence the breast, as Co interacts with the sex-linked Silver (S) and has the greater influence, restricting Aph and Mahogany. If Aph^I is substituted for Aph in this last case, Mahogany does not express at all, as Aph is restricted and Mahogany requires Aph as a platform to express. The only effect of Mahogany in such an instance may be one or two red feathers in the shoulder of the male and a slightly darker brassy tone to the hackles and saddles, especially at the top of the head.

As you can see, the interactions of Aph and Aph^I with Db and Co are very complex and I hope my attempt here to explain some of these interactions has not caused you even

more confusion. In the future, I hope to undertake a much more detailed description of these interactions, but for now, and the sake of brevity in an article, I hope this will give you a good point to begin to understand the many phenotypes that can emerge when dealing with the combination of many genes.

It is important to remember, also, that when dealing with heterozygotes, the visual expressions can be variable. To fully understand the results of various combinations, we must see them as homozygotes. However, most breeders out there who encounter such combinations will likely be seeing heterozygosity at various levels and this can make the expressions even harder to judge.

While the basic premise of Autosomal Pheomelanin and the Inhibitor of Autosomal Pheomelanin are fairly simple concepts and in practice are simple to recognize and work with, the fact that there are potentially many interaction genes means that this simple concept of Aph and Aph^I can seem very complicated and overwhelming. It is true that a multi-gene recombinant phenotype can be very hard to judge, especially when there is high heterozygosity at many alleles, but the most basic aspect, that of Aph and Aph^I, can be summed up very easily. All domestic fowl have Aph, just as all have sex-linked pheomelanin and eumelanin. In general, those birds with one dose of Aph^I will only show partial expression of Aph, while only those birds with homozygosity for Aph^I will not show any visual expression of Aph. The important thing to remember is that the expression of Aph will vary depending on the dosage effect of Aph^I and the other (potentially many) genes that are interacting with both Aph and Aph^I. It is these potential interactions that make this a complicated and often confusing subject.
